Fabrication and characterization of poly (vinyl alcohol)/functionalized graphene oxide nanofibers produced by electrospinning method

Chih-Jie Jan and Yuan-Hsiang Yu*

Department of Chemistry, Fu Jen Catholic University, Xinzhuang Dist., New Taipei City 24205, Taiwan (R.O.C.)

Abstract:

A series of poly (vinyl alcohol) (PVA) functionalized graphene oxide (FGO) nanofibers with low loading ratios of FGO to PVA were fabricated by electrospinning. In this study, the prepared PVA/FGO nanocomposites were dispersed in water phase followed by electrospinning treatment under different operational parameters (i.e., applied voltage, flow rate and FGO contents) to give nanofibers of various diameters and morphologies. The morphology, diameter and structure of electrospun nanofibers and FGO were characterized by Fourier transform infrared (FTIR) spectroscopy, X-ray photoelectron spectroscopy (XPS), scanning electron microscopy (SEM), transmission electron microscopy (TEM) and X-ray diffraction (XRD). SEM images showed that the morphologies of the nanofibers were improved by the incorporation of FGO at a low loading content (e.g., 0.1–0.5 wt %) into PVA. The crystallinity, storage modulus and thermal stability of PVA/FGO nanofibers were also studied.

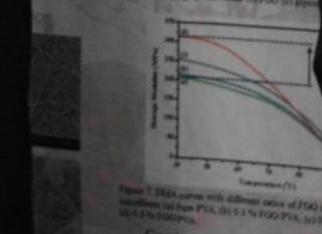

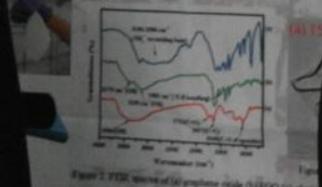

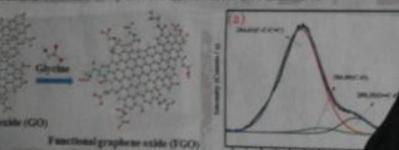

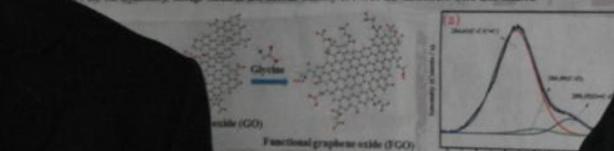

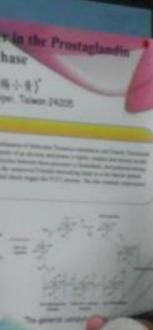

Figure 3 DSC curves with different ratios of FGO in the PVA nanofibers (a) from PVA, (b) 0.1% FGO/PVA, (c) 0.5% FGO/PVA.

Conclusions:

A series of FGO/PVA nanocomposites were prepared successfully by electrospinning. The morphology, diameter and structure of electrospun nanofibers and FGO were characterized by FTIR, XRD, SEM and TEM. The morphologies of the nanofibers were improved by the incorporation of FGO at a low loading content (e.g., 0.1–0.5 wt %) into PVA.
